

WILDLIFE FOOD CACHE MEMORY GAME

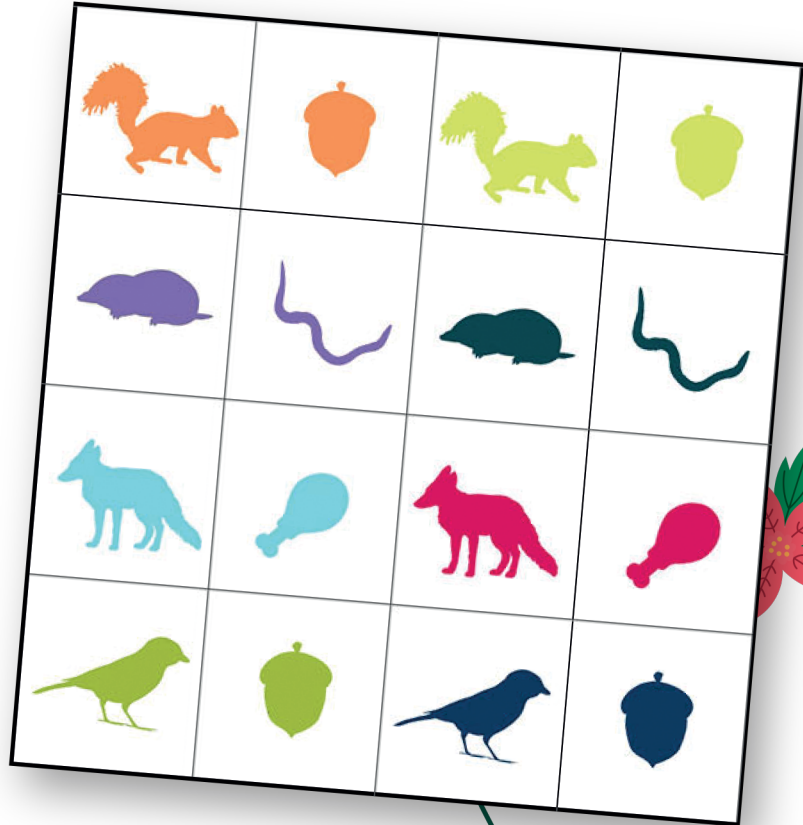

During winter, it's harder for animals to find food but animals like squirrels, moles, foxes and jays have a clever trick up their sleeves. They create a store (or a cache) of food by hiding it underground, or in their nests or dens. They can then go back to it whenever they feel hungry.

Test your cache-finding memory with this matching game. You can play on your own or with another person.

HOW TO PLAY

1. Cut out the tiles and lay them out on a table or the floor. Be careful when using scissors.
2. Take time to remember what food each animal eats
3. Turn all the tiles over so that they are face-down
4. Mix them up without looking at the picture underneath - no peeking!
5. Now turn over two at a time to see if you can find the animal and food pairs
6. If you match the animal with its food you can keep the pair
7. If you end up with an odd pair, turn those two back over and have another go
8. See how quickly you can find them all
